# 1 Servlets

Currently the BIRT Viewer supports the following servlets:

## 1.1 frameset

This servlet is used to preview a report. It uses the Ajax framework to display a user interface, containing a toolbar, navigator bar and a table of contents pane. It allows the user to do additional operations like export data, export report, print, etc. This mode uses the Report Engine's "Run" task, followed by a "Render" task to generate the output. A report document will be generated first.

## 1.2 run

This servlet is used to preview a report. It uses the Ajax framework, and the display only contains the generated report content. This mode uses the Report Engine's "RunAndRender" task to generate the output. No report document is generated.

## 1.3 preview

This servlet is used to preview a report. It does not use the Ajax framework and directly uses the Engine API to generate the report content. This mode also calls the Report Engine's "RunAndRender" task to generate the output. No report document is generated.

## 1.4 document

This servlet is used to generate a report document from a report design. The generated document can be either saved on the server side through configuration or downloaded on the client side. This mode uses the Report Engine's "Run" task only.

## 1.5 output

This servlet is similar to "frameset". It generates the report document first and renders it. The difference is that this mode does not use Ajax, but just output the report content directly to the browser.

## 1.6 parameter

This servlet is used to bring up the Parameter Dialog. Normally this should not be used directly. Instead the user can use the "parameterPage" JSP tag to integrate the parameter UI into their own JSP pages.

## 1.7 download

This servlet is used to extract CSV data from a report document. This is now deprecated, the "extract" servlet must be used instead.

## **1.8 extract**

This servlet is used to extract data from a report document. The user can specify the data format or extraction extension name for different output.

## 2 The “web.xml” file

Currently, the web.xml file from the BIRT viewer supports the following context parameters:

### 2.1 Basic settings

#### 2.1.1 BIRT\_VIEWER\_LOCALE

Sets the default locale for the viewer application. The Viewer will search the locale setting using the following order:

1. Locale in URL parameter (“\_\_locale”).
2. Locale in HTTP request from the client side browser setting.
3. Locale in web.xml.

#### 2.1.2 BIRT\_VIEWER\_WORKING\_FOLDER

Sets the default working folder for the viewer application. The user can put report design files or report document files under this folder. Then it will be possible to use a relative path in the URL to access these reports. The default setting is the current web application root folder.

This setting supports three formats:

##### 1. Relative Path

The folder path is relative to current web application root folder.

##### 2. Absolute Path

The folder path is absolute on the local file system.

##### 3. Java System Property

A Java system property like for example “\${myworkingfolder}”. It is possible to define its value by passing the following argument to the JVM: “-Dmyworkingfolder=D:/reports”.

#### 2.1.3 BIRT\_VIEWER\_DOCUMENT\_FOLDER

Sets the default folder path to where the generated report document files will be saved. The default value is “documents”. Please refer to BIRT\_VIEWER\_WORKING\_FOLDER setting for the detailed path syntax.

#### 2.1.4 WORKING\_FOLDER\_ACCESS\_ONLY

Sets whether the viewer application can only access report files under the working folder. If this is set to “true”, all report files outside the working folder cannot be accessed by the viewer. The default value is “false”.

#### 2.1.5 BIRT\_VIEWER\_IMAGE\_DIR

Sets the folder path where the temporary image files will be stored. The

default value is "report/images". Please refer to the BIRT\_VIEWER\_WORKING\_FOLDER setting for detailed path syntax.

#### **2.1.6 BIRT\_VIEWER\_SCRIPTLIB\_DIR**

Sets the path for the user Java library files (normally used for Java event handlers). The default value for this setting is "scriptlib". Please refer to the BIRT\_VIEWER\_WORKING\_FOLDER setting for the detailed path syntax.

#### **2.1.7 BIRT\_VIEWER\_CONFIG\_FILE**

Sets the path to the "viewer.properties" file. Normally this setting should not be changed by the user. Please refer to the viewer.properties section for more details.

#### **2.1.8 BIRT\_RESOURCE\_PATH**

Sets the folder path for the user resources. A resource can be a report library, an image and a css file. The default value is the web application root folder. Please refer to the BIRT\_VIEWER\_WORKING\_FOLDER setting for the detailed path syntax.

### **2.2 Features and behavior**

#### **2.2.1 BIRT\_OVERWRITE\_DOCUMENT**

Sets whether the temporary report documents must be overwritten, even if they are already available, in "frameset" or "output" mode. If this setting is "true", each time when a report is rendered, it will regenerate the report document. Otherwise, it will reuse the existing report document.

#### **2.2.2 BIRT\_VIEWER\_PRINT\_SERVERSIDE**

Sets whether the server printing feature must be enabled in frameset mode. The value can be "ON" or "OFF". The default value is "ON".

#### **2.2.3 HTML\_ENABLE\_AGENTSTYLE\_ENGINE**

Sets whether the user agent style processing must be used. This setting will be passed to the report engine and is used to control the CSS processing. If this setting is "true", the generated CSS-code will be optimized for the user's browser. Else, generic CSS that works in all the browsers will be used. The default value is "true".

#### **2.2.4 BIRT\_FILENAME\_GENERATOR\_CLASS**

Sets the full-qualified Java class name that handles the naming logic for the output files. The given class should implement the Java interface "org.eclipse.birt.report.utility.filename.IFilenameGenerator". If this setting is not specified, the default file naming logic will be used. The default value is empty.

## **2.3 Logging**

### **2.3.1 BIRT\_VIEWER\_LOG\_DIR**

Sets the path where the log files will be stored. The default value is "logs". Please refer to the BIRT\_VIEWER\_WORKING\_FOLDER setting for detailed path syntax.

### **2.3.2 BIRT\_VIEWER\_LOG\_LEVEL**

Sets the logging level. The possible values are the following:  
"ALL", "SEVERE", "WARNING", "INFO", "CONFIG", "FINE", "FINER", "FINEST",  
"OFF"

## **2.4 Limitations**

### **2.4.1 BIRT\_VIEWER\_MAX\_ROWS**

Sets the maximum number of rows that can be retrieved from one dataset. This parameter is normally used at design time to avoid inadvertent memory issues. The default value is empty, which means no limit.

### **2.4.2 BIRT\_VIEWER\_MAX\_CUBE\_ROWLEVELS**

Sets the maximum number of row levels that can be retrieved from one cube. The default value is empty, which means no limit.

### **2.4.3 BIRT\_VIEWER\_MAX\_CUBE\_COLUMNLEVELS**

Sets the maximum number of column levels that can be retrieved from one cube. The default value is empty, which means no limit.

### **2.4.4 BIRT\_VIEWER\_CUBE\_MEMORY\_SIZE**

Sets the maximum memory size used during cube generation. If the cube size exceeds this setting, it will be written to disk. This setting allows the user to do some performance tweaking.

## 3 The “viewer.properties” file

The “viewer.properties” file contains some advanced configuration settings for the BIRT viewer.

### 3.1 Base URL setting

The following section is used to configure the base URL for the viewer output. If the web application is behind a Proxy, the URL from the request may contain an unexpected address. The user can change this setting to configure the custom base URL.

```
# configurable variable for JSP base href. Please uncomment the below line.  
#base_url=http://127.0.0.1:8080
```

### 3.2 Export extensions settings

The following section is used to configure the file extensions for each format used in the “export report” feature in the “frameset” mode:

```
# [EXTENSION SETTING]  
viewer.extension.html=html  
viewer.extension.pdf=pdf  
viewer.extension.postscript=ps  
viewer.extension.doc=doc  
viewer.extension.xls=xls  
viewer.extension.ppt=ppt
```

The following section is used to configure the display name for each format used in the “export report” feature in the “frameset” mode.

```
# [OUTPUT FORMAT LABEL NAME]  
viewer.label.html=HTML  
viewer.label.pdf=PDF  
viewer.label.postscript=PostScript  
viewer.label.doc=Word  
viewer.label.xls=Excel  
viewer.label.ppt=PowerPoint
```

### 3.3 CSV separators settings

The following section is used to configure the separators for the CSV data extraction. The user can add additional separators (one character only, not string), but the JSP files and the “messages.properties” files must be modified as well.

```
# [CSV SEPARATOR]
viewer.sep.0=,
viewer.sep.1=;
viewer.sep.2=:
viewer.sep.3=|
viewer.sep.4=\t
```

The following section is used to configure the loggers for the different BIRT components. The format must be "logger.<component name>". Each component should already have defined their relevant loggers. The log level can be configured separately for each logger. If no level is specified or the value "DEFAULT", the setting from web.xml will be used.

```
# [LOGGERS]
# "logger."+class=level
# if no level is specified or the text "DEFAULT",
# then the default level from the web.xml will be used
logger.org.eclipse.datatools.connectivity.oda=DEFAULT
logger.org.eclipse.datatools.enablement.oda=DEFAULT
```

## 4 URL Parameters

Currently, the BIRT viewer supports the following URL parameters:

### 4.1 Report output settings

To be able to display a report, one of `__report` or `__document` must be specified in the URL.

#### 4.1.1 `__report`

Specifies the path of the report design file to run or preview. The path can be either relative or absolute. The relative path is relative to the working folder defined in the web.xml file.

#### 4.1.2 `__document`

Specifies the path of the report document file to be previewed. The path can be relative or absolute. The relative path is related to the working folder that is defined in web.xml.

You can also specify "`__report`" and "`__document`" at the same time in the URL. The viewer will first check for the existence of specified report document, if it does not exist, it will generate the document file from report design. Otherwise, the found report document will be used directly.

#### 4.1.3 `__locale`

Specifies the locale to use for the report output and for the viewer user interface, if applicable. The locale value must be in the regular format as: `<language>_<country>`. For example "`en_US`".

#### 4.1.4 `__resourceFolder`

Please refer to `BIRT_RESOURCE_PATH` in the web.xml section.

#### 4.1.5 `__svg`

Specifies whether the charts can be output in the SVG format in the report output. If this parameter is not specified, in frameset and run mode, the viewer will detect whether the client browser supports the SVG format.

Possible values: **true** | **false**

### 4.2 Viewer layout

#### 4.2.1 `__showtitle`

Specifies whether the title section must be shown in the "frameset" mode. The title itself can be modified using the `__title` parameter.

Possible values: **true | false**

#### 4.2.2 **\_\_title**

Specifies the custom title to display instead of "BIRT Report viewer" in "frameset" mode. This value also affects the browser's title bar.

#### 4.2.3 **\_\_toolbar**

Specifies whether the toolbar must be shown in "frameset" mode.

Possible values: **true | false**

#### 4.2.4 **\_\_navigationbar**

Specifies whether the navigation bar must be displayed in "frameset" mode.

Possible values: **true | false**

#### 4.2.5 **\_\_rtl**

Specifies whether the viewer's user interface must be displayed using the right-to-left direction. The default value is "false" (left to right). Please note that this only affects the viewer UI itself, not the report content. The direction of the content can be defined in the report design itself.

Possible values: **true | false**

### 4.3 Pages, bookmarks and reportlets

#### 4.3.1 **\_\_page**

Specifies the page number from the report to display.

#### 4.3.2 **\_\_bookmark**

Specifies the bookmark to jump to within the report.

#### 4.3.3 **\_\_istoc**

Specifies whether the given bookmark specified in "\_\_bookmark" is a table of contents (TOC) name or a bookmark name. If this parameter is **true**, the viewer will jump to the relevant TOC location using the given name.

Possible values: **true | false**

#### 4.3.4 **\_\_isreportlet**

Specifies whether the current output is in reportlet mode.

Possible values: **true | false**

To output a reportlet, BIRT currently provides two ways:

1. Using a bookmark: Define a bookmark "myBookmark" on a specific report item, then use following URL syntax to specify the reportlet to output:

<http://localhost:8080/birt/frameset?>

[\\_\\_report=test.rptdesign&\\_\\_bookmark=myBookmark&\\_\\_isreportlet=true](#)

2. Using an instance id: the instance id is only available at runtime. It is possible to find it out from the HTML code ("iid" attributes). The following URL syntax uses an instanceId for the reportlet:

[http://localhost:8080/birt/output?  
\\_\\_report=test.rptdesign&\\_\\_instanceid=iid&\\_\\_isreportlet=true](#)

Note: the reportlet feature only works for report documents. To be able to output reportlets for a report design, the "frameset" or "output" modes must be used to automatically generate the report document first.

## 4.4 Export to format

### 4.4.1 \_\_asattachment

Specifies whether the client browser must consider the previewed report as an attachment. If set to "true", the user will get a download dialog box to download the report content. Otherwise, the report content will be displayed in the browser window. This parameter is mainly used for the PDF or other non-html formats. Possible values: **true | false**

### 4.4.2 \_\_format

Specifies the output format for the report preview. The default value is "html". BIRT has built-in support for PDF, DOC, XLS, PostScript and PPT. The user may add additional formats through the report engine extensions. Please note that multiple extensions can output the same format. In this case, the first matching extension will be used. The user can use "\_\_emitterid" to select a specific extension.

### 4.4.3 \_\_pageoverflow

Specifies the page overflow behavior for PDF and PostScript output.

Possible values:

- 0** Output to multiple pages
- 1** Enlarge page size
- 2** Fit to page

## 4.5 Data Extraction Related

### 4.5.1 \_\_exportdatatype

Specifies whether the data type of the columns must be exported along with the data. This is normally only used by CSV exporting.

Possible values: **true | false**

#### **4.5.2 \_\_exportEncoding**

Specifies the encoding name for the data extraction. Example values: "UTF-8", "ISO-8859-1", "GBK", "GB2312".

#### **4.5.3 \_\_extractformat**

Specifies the format for the data extraction. For example: "CSV", "XML".

#### **4.5.4 \_\_localeneutral**

Specifies whether the extracted data must be exported in a locale-independent format. This is valid for date, time, datetime values and also numbers.

Possible values: **true | false**

#### **4.5.5 \_\_resultSetname**

Specifies the name of the result set from which to extract the data.

#### **4.5.6 \_\_selectedColumn**

Specifies the column name to be exported. The syntax is:

\_\_selectedColumn<columnIndex>=<columnName>. For example:

\_\_selectedColumn0=column1&\_\_selectedColumn1=column2.

#### **4.5.7 \_\_selectedColumnNumber**

Specifies the total number of columns specified using the \_\_selectedColumn parameters.

#### **4.5.8 \_\_sep**

Specifies the separator for the CSV data extraction. The syntax is:

\_\_sep=<sepIndex>. The separator indexes are defined in the "viewer.properties" file. Please refer to the "viewer.properties" section for more details.

Default values are:

- 0** Comma ","
- 1** Semicolon ";"
- 2** Colon ":"
- 3** Pipe "|"
- 4** Tab "\t"
